Fall Birds — Answer Key

Did you know?

- Many migrating birds follow established routes called flyways, some used by the same species for generations.
- Some birds appear to sense Earth's magnetic field to help navigate during migration, a real ability called magnetoreception.
- Certain small songbirds migrate at night, possibly using stars for orientation, and rest and feed during the day.
- Not all birds migrate the same distance; some travel thousands of miles, while others simply shift to a slightly milder nearby region.
