Did you know?

- Leaves don't actually turn orange and yellow; those colors are there all year, just hidden underneath the green chlorophyll until it breaks down in fall.
- The red color in some fall leaves comes from a different pigment, anthocyanin, which many trees only produce specifically in autumn.
- Warm, sunny fall days followed by cool nights tend to produce the most vivid red leaf color, since that combination boosts anthocyanin production.
- Peak foliage timing varies by region and even by year, driven by temperature and rainfall rather than a fixed calendar date.
