Jungle Animals — Answer Key

Did you know?

- Jungles, found mainly near the equator, are home to more species of plants and animals than any other habitat type on Earth.
- Many jungle animals, like sloths, move slowly on purpose to conserve energy in a food-scarce environment.
- The dense canopy of a jungle can block so much sunlight that very little vegetation grows on the forest floor itself.
- Poison dart frogs, found in jungle habitats, get their toxicity from compounds in the insects they eat.
