Life Cycles — Answer Key

Did you know?

- Many insects undergo complete metamorphosis, changing dramatically through egg, larva, pupa and adult stages.
- A frog begins life as an egg, hatches into a swimming tadpole, and only later develops legs and lungs as an adult.
- Some animals, like certain salamanders, can regenerate lost body parts during their life cycle.
- Life cycle lengths vary enormously across species, from insects that live only days to tortoises that can live over a century.
