Did you know?

- Jupiter is the largest planet in the solar system, more massive than all the other planets combined.
 - Venus is the hottest planet in the solar system, even hotter than Mercury, due to a runaway greenhouse effect from its thick atmosphere.
 - A day on Venus is longer than its year: the planet rotates so slowly that one full spin takes longer than one trip around the Sun.
 - Saturn's rings are made almost entirely of ice particles, with a small amount of rocky debris mixed in.
-
