Plants — Answer Key

Did you know?

- Plants absorb carbon dioxide and release oxygen during photosynthesis, a process essential to most life on Earth.
- Not all plants need soil to grow; some, like certain orchids, can grow attached to trees, absorbing moisture from the air.
- The world's tallest trees can grow over 300 feet tall, taller than a 25-story building.
- Some seeds can remain dormant for years, even decades, waiting for the right conditions before sprouting.
