Scientific Method — Answer Key

Did you know?

- The scientific method relies on forming a hypothesis and then testing it through repeatable experiments, not just observation alone.
- A good experiment changes only one variable at a time, so researchers can tell what actually caused a result.
- Peer review, where other scientists check a study before publication, is a key step in verifying new findings.
- Scientific theories are never considered absolutely final; they are always open to revision if new evidence contradicts them.
