Spring Weather — Answer Key

Did you know?

- Meteorologists define spring as running from March 1 through May 31, a fixed three-month period distinct from the astronomical equinox-to-solstice definition.
- Spring is genuinely one of the more unpredictable seasons in many regions, since cold winter air and warm summer air are actively clashing overhead.
- Some regions see their peak tornado activity specifically in spring, when that clash between cold and warm air masses is strongest.
- Daylight hours lengthen measurably each week during spring, a real, gradual change rather than a sudden shift.
