Did you know?

- A single bolt of lightning can heat the surrounding air to temperatures hotter than the surface of the Sun.
- Snowflakes almost always form with six-sided symmetry, a result of how water molecules bond as they freeze.
- Hurricanes and typhoons are the same type of storm, just given different names depending on where in the world they form.
- Meteorologists track humidity, pressure and wind together, since weather forms from the interaction of all three, not any single factor alone.
